13. Other: ____.

Continuation of 11, does NOT place the application in condition for allowance because: Applicant argues that Dawson does not teach "a comparator which compares shared folders of the present search with those of the last search."

In response to the preceding arguments examiner respectfully submits that Dawson teaches "a comparator which compares shared folders of the present search with those of the last search" as if the found set is not confirmed by the user, an alternate method (Step 72) is automatically initiated on behalf of the user to find appropriate images to share. Each found set is displayed again in Step 68 and the cycle of searching and confirming repeats until the desired set of images has been designated (Step 78). One such alternate method involves commonly used natural language processing techniques such as looking for synonyms of the theme and searching on those terms. Another alternate method of searching the database is to use the theme to search image filenames (Dawson Paragraph 0100). Nara further teaches "a comparator which compares shared folders of the present search with those of the last search" as (Nara Paragraphs 0054-0057). In these lines the search information is being stored in a table and is being later on compared with future searches for updating the use-condition of all the devices/information processing apparatuses on the network.

Further, applicant argues that there is no motivation or suggestion to combine these references.

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See In re Fine, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and In re Jones, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, Dawson teaches a system for sharing images over a communication network between multiple users and Nara teaches a network system device map showing the status of the devices on the network. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teaching of the cited references because Nara's teachings would have allowed Dawson to provide a device-map display method which correctly and efficiently provide the user with the status information of the devices connected to a network to allow the user to improve work efficiency (sharing of images on the information processing devices) by comparing the status of the network devices.
